

Quiz10- MA478

Clark

The dataset `suicide` from `library(faraway)` contains one year of suicide data from the UK cross-classified by sex age and method.

- Determine if there is a relationship between the variables (i.e. are they independent of one another?)
- Collapse sex and age into a single six-level factor containing all combinations of sex and age. Conduct a correspondence analysis and give an interpretation of the plot. (Different ways to do this, but 'sex:age' may be helpful)
